Exercise for you and for the one you care for

Cala Sielaff & Brad Stewart
Prevalence of Care Giving

Overall Stats:
• It is estimated that 80 percent of all care received by older Americans is provided by family members.
• The average length of care giving is 4.3 years.
• Many caregivers fulfill multiple roles. Most caregivers are married or living with a partner (62%), and most have worked and managed care giving responsibilities at the same time (74%).

Caregivers and Work
• Almost 60% of all caregivers either work or have worked while providing care.
  – 62 percent have had to make adjustments to their work life, such as reporting late to work or giving up work entirely.

wellbeing@wsu.edu
Physical Strain on Care Givers

• Studies show that approximately one-third of caregivers provide intensive care although they are themselves in “fair to poor” physical health.

• Studies have found that caregivers may have increased blood pressure and insulin levels, may have impaired immune systems and may be at increased risk for cardiovascular disease among other adverse health outcomes.

Benefits of Physical Activity

• What do you do for preventative care?
• What can physical activity do for you?
  – Decrease risk of disease
  – Lower blood pressure and cholesterol
  – Decrease stress by releasing endorphins
  – Prevent against musculo-skeletal injuries
  – Increase self efficacy
Physical Activity 101

• The make-up of your body:
  – Bones
    • Load and movement
  – Organs
    • Efficiency of the heart and lungs
  – Muscles
    • Importance of warming up
  – Connective Tissue
    • What is it?
### ACSM Guidelines

#### Muscular Strength and Endurance

| What is it?       | Strength: Ability to overcome a larger external force  
|                  | Endurance: Repeatedly overcome or sustain a force |
| Type:            | Any activity that creates **overload** to the muscles in the form of an external force. *Examples?* |
| What activities? |                                                                                       |
| Frequency:       | 2-3 days per week for each major muscle group.                                           |
| How often?       |                                                                                       |
| Intensity:       | To the point of fatigue within 8-12 repetitions.                                        |
| How hard?        |                                                                                       |
| Time:            | At least one set of repetitions for each major muscle group.                             |
| How long?        |                                                                                       |

Sleep

• Inhibitions of a good nights sleep
  – What keeps you up at night?

• Lack of sleep is the third highest impediment to overall performance
Summary

• Take care of yourself!!
  – SLEEP!
  – Eat
  – Exercise
  – Take time for yourself
